

Device for Connecting Ends of Bars

Abstract

A device for connecting bar ends has a pipe section into which the rods to be connected are inserted with their ends. Several clamping elements each having an outer thread are provided that can be secured in threaded bores of the pipe section by being screwed in. The clamping elements are arranged in two rows and are positioned, relative to the circumference of the pipe section, on the same side of the pipe section. The clamping elements are staggered relative to one another.
